

Better vital signs for patient-centered healthcare

Find out how DIRT's digital construction improves outcomes for personnel and patients alike. From critical care units to urgent care facilities, DIRT supports all healthcare space needs. Working with DIRT shortens your construction schedule which means seeing patients, and revenue, sooner. Your spaces will be ready to adapt to whatever the future brings. Downtime for maintenance is shortened from days to minutes.

DIRT's manufactured interiors incorporate patient-centered and evidence-based design to alleviate the most common and complex building challenges you face. Focused on process changes that result in reduced construction schedules, DIRT's approach provides significant time savings which allows your healthcare space to start accepting patients much quicker.

Fast and On Time

Your project ships in 21 days or less, regardless of how large or complex it is. No schedule extensions. Design decisions can be made right up to the last possible minute without hurting budget or schedule. You will be welcoming patients into your new space weeks sooner.

Patient-centered design

DIRTT is customized prefab. Our components act like building blocks, coming together in infinite ways to match dimensions, materials, and functionality. With this much freedom, it's easy to configure your space to balance patient and medical needs.

Certainty

Explore your space in rich 3D before it's built. The beauty of it? What you see is actually what you get. 3D design software ensures your design is translated precisely to the factory floor. The best part? Advanced manufacturing ensures the quoted cost is the final cost. Done are the days of budgets doubling during project execution

Accessible cavities

Modularity means maintenance is a snap. Accessing the wall cavity to work on utilities and electrical is quick and easy, without requiring finish repair work. If something is damaged, you only need to replace that small section. Noise and lengthy disruptions become a thing of the past.

Infection prevention and control

Effective design elements reduce touch points. Hospital-grade finishes help lower infection rates. Flexible hanging options move technology, millwork, and accessories off the floor. Wipeable surfaces make disinfecting the space more efficient. Having accessibility into the cavity allows easy access to embedded technology.

Interactive Options

Add interactivity to your space. This could be distraction for young patients with games or integrated technology. Writable surfaces track patient info and maximize functionality.
